

1 Problem Statement

In this project, you will be analyzing a restaurant revenue prediction data set with the goal of predicting the annual revenue of a restaurant. The data set includes information on the restaurant's location, brand, type, and opening date, as well as 200 unknown features which could be information on specific menu item purchases.

You will start by exploring the data and identifying any patterns or trends. From there, you will fit machine learning models to determine the factors that have the greatest impact on restaurant revenue.

Based on your analysis, you will determine what a company should do to increase the restaurant's revenue, such as where to open a new restaurant and what type of restaurant brand or type should be used. You will also evaluate the effectiveness of these strategies by predicting their impact on future revenue.

Overall, this project will provide you with a hands-on opportunity to apply machine learning and big data skills to real-world data, while also developing insights that can help a restaurant improve its business.

2 Data Description

Revenue The annual revenue amount in USD from 2022

City Miami, Fort Lauderdale, Orlando, Tampa, Other

Brand Chicken Shack, Burger Joint, Taco Hut, Pizza Man

Type Full, Express, Food Court, Delivery

OpenDate The date the restaurant was opened

X1–X200 Represents 200 unknown features
